

FLUORIDATION OF WATER SUPPLIES

FLUORIDATION IS RECOGNISED AS A SAFE AND EFFECTIVE PUBLIC HEALTH MEASURE DEMONSTRATED TO IMPROVE THE DENTAL HEALTH OF THE COMMUNITY

FLUORIDE AND HUNTER WATER

Fluoride is naturally present in low concentrations in Hunter Water's sources. In addition, fluoride is added to drinking water supplied by Hunter Water in the form of Fluorosilicic Acid.

WHY FLUORIDATE?

Fluoride in water helps prevent tooth decay. It is particularly effective in protecting children's teeth while they are forming and helps reduce dental decay in adult teeth.

Fluoridation of public water supplies in New South Wales is regulated under the Fluoridation of Public Water Supplies Act 1957, and the Fluoridation of Public Water Supplies Regulation 2012. Hunter Water is required under this legislation to fluoridate its supplies to a level determined by the NSW Department of Health.

A [fact sheet](#) on fluoridation of drinking water from NSW Health provides more information on why to fluoridate.

WHAT LEVEL OF FLUORIDE IS IN DRINKING WATER SUPPLIED BY HUNTER WATER?

The typical concentration of fluoride in drinking water supplied by Hunter Water is one milligram per litre. This is within the recommendations of the National Health and Medical Research Council (NHMRC) Australian Drinking Water Guidelines. The dosing range used by Hunter Water is specified in regulations produced by NSW Health.

IS FLUORIDE SAFE?

Scientific evidence confirms that fluoride in drinking water is safe and effective for people of all ages. The latest National Health and Medical Research Council systematic review of fluoride and health, *A Systematic Review of the Efficacy and Safety of Fluoridation (2007)*, states that fluoridation of drinking water remains the most effective measure for reducing dental decay. A brief summary of the report can be found in the National Health and Medical Research Council [Public Statement](#).

WHO SUPPORTS FLUORIDATION OF DRINKING WATER?

The overwhelming weight of scientific evidence supports community water fluoridation as a safe and effective measure in the prevention of dental decay. Relevant scientific evidence is regularly and systematically reviewed by the major health advisory organisations. On this basis, fluoridation of public water supplies is endorsed by numerous health advisory organisations, including the World Health Organisation, the US Centres for Disease Control and Prevention and Australia's peak medical advisory organisation - the National Health and Medical Research Council.
